

ILV INSTITUTE

The Lavoisier Institute of Versailles (UMR 8180) is a joint CNRS / UVSQ research unit created in 1994. It includes an average of 100 people including CNRS researchers, teacher researchers, engineers and technicians and students.

The ILV is structured into three research groups. A common technical platform includes all the semi-heavy equipment common to the unit. The organizing chart is completed by an administrative / computer and communication management service.

Finally, the ILV has transverse classical bodies: a health and safety committee comprising 3 prevention assistants and the Management, a laboratory council and a management committee including the Management, a representative of each team and the head of the department.
